

**Wild bird installation.** Save money + give a new activity to an urban park.

**Problem:** There is a big area inside the park (7.000 m<sup>2</sup>), that very few people go there. You spent a lot of money in maintenance, street lamps, cleaning , gardening Etc.

**Solution:** You built a “Bird Island”, you dont let people get in, people see the birds from the outside, its a new attraction and you save money + you help birds breeding, specially protected species.

Nest from inside the house  
(You can control the birds)  
Needs no maintenance.

*Riparia riparia*  
Eat annoying insects  
like wasps

People volunteer collaborates building bird houses + join ecological information

Species like bats eat thousands of mosquitoes per night and you don't need to fumigate next to the terraces and bars (More ecological + saving money)
